

Partner Portfolio Project

Deliverable 1

Find a Data Set

In this project, you will be analyzing data and creating visualizations to tell the story in the data. It allows you to demonstrate your descriptive analytics and visualization skills. If well executed, it could make a nice addition to a digital portfolio for a job or graduate school application or interview.

For this project deliverable, you will need to find a dataset to use for this project. I encourage you to find a data set for a topic that is interesting to you. It could be related to a company or industry in which you would like to work. It could be related to a personal interest. If you are working, it can come from your work PROVIDED you have permission to use it.

The **requirements** for this dataset are:

- The data must be about something ‘real’.
- The data set must have both categorical and quantitative variables (min: 2 of each).
- The data set must be at least 100 observations.
- You need to be able to ask interesting questions that you will answer using the data.

Prepare 2 files to submit to Microsoft Teams assignment

1. Raw data file just as you acquired it. This does not need to be an Excel file. Include “**raw data**” in the file name.
2. Cleaned and documented data set in Excel. Include “**deliverable 1**” in the file name.

Here are the tasks required to prepare the data set in #2.

- a) If needed, clean the data set as described in your text and class. It should also be moved into Excel if it is not already.
- b) Create a tab in the Excel file called **Data Dictionary**. List each variable:
 - Is it categorical or quantitative?
 - Briefly describe the variable
- c) Create a tab in the Excel file called **Source**. In this tab, provide
 - i. **Describe** how you acquired this data set. Select from:
 - If from the web – provide the web site
 - If from work – describe how it was collected and provide permission
 - If from a survey – describe how it was collected and why
 - If another source – describe in a way that I could replicate and obtain the data
 - ii. **Write** a data set description. See Breakout 1/28b for a reminder of how to write a data set description.
 - ii. What is your **interest** in this data set? 2-5 sentences.
 - iii. **Questions** – List questions you would like to explore with this data set. (min. 2 questions)
 - These should be “**managerial**” questions.
 - Don’t list questions like “what is the mean age of the customers”? You will answer those questions in the process but ask higher-level questions, such as which customers by age purchase using a smart phone.
